

Supporting Information S1. The benchmark dataset used for studying the PPIs in *S. cerevisiae*. It contains 50,652 protein pairs, of which 17,505 are interactive and 33,147 non-interactive pairs. Two proteins in an interactive pair are interacting with each other in a cell, but not in a non-interactive pair. All the pairs are represented by the DIP codes (Xenarios, I. et al. Nucleic Acids Res., 2002, 30, 303-305), and the two counterpart proteins in a pair is separated by a hyphen "-". All the pairs listed below were derived from 7,374 proteins, none of which has $\geq 40\%$ sequence identity to any other. Also, all the proteins considered here contain at least 50 amino acids or longer.

(1) Positive subset consists of 17,505 interactive pairs
